SUMMARY

Backend engineer with five years building distributed systems and cloud-native platforms in **Go**. Comfortable across everything a service needs — data modelling, API design, deployment, and the on-call that follows — with a bias toward correctness, observability, and predictable behaviour under load.

EXPERIENCE

IDFC FIRST Bank

May 2026 – Present

Senior Developer

Bengaluru, IN

- Build the **Document Management System** serving millions of retail customers and thousands of internal users, on a Go microservice stack backed by MongoDB.
- Rebuilt the search path — query planning, indexing strategy, and result pagination — taking retrieval from **50 s to 500 ms** across tens of thousands of documents.
- Led a metadata-flattening initiative spanning a Go service, MongoDB, and a React client: unified HR document storage into a single indexed collection, halved the search API from two round trips to one, and fixed a production defect that broke every employee-filtered search.

HashiCorp, an IBM Company

Mar 2025 – Apr 2026

Engineer II

Bengaluru, IN

- Core contributor to **Consul**, a service mesh and service discovery platform for multi-cloud and hybrid environments; on-call rotation for HCP and enterprise customers.
- Implemented enterprise census reporting, enabling reliable license utilisation tracking via **Raft-based consensus**, with export to CRM and secure file sharing.
- Shipped core platform capabilities — configurable Virtual IP ranges, improved **API Gateway** upstream discovery, and a randomised ACL login stagger — improving scalability and load distribution across large Kubernetes clusters.

Infoblox

Aug 2022 – Feb 2025

Software Engineer I → II

Bengaluru, IN

- Built Go-based **Kubernetes controllers** and supporting microservices managing IPsec, VxLAN, and OVS traffic routing, enabling secure connectivity to Infoblox-hosted cloud DDI services and seamless migration from on-premise systems.
- Contributed to **infobloxopen/db-controller** (open source), enabling RDS lifecycle management through Kubernetes CRDs, and migrated production services onto it.
- Automated AWS provisioning with Crossplane (EKS, Redis, DynamoDB) and GitOps infrastructure-as-code via FluxCD and KubeVela, reducing cluster creation to **under two hours** and standardising monitoring on Prometheus and Grafana.
- Developed internal CLI and debugging tooling to inspect controller state and networking flows, materially cutting triage time during development and production incidents.

- Wrote a Go package abstracting pluggable object-storage backends (AWS S3, MinIO, NooBaa) with unit, integration, and performance test suites; adopted across all services.
- Implemented REST APIs for redundancy synchronisation and extended SNMP for HMS end-of-service notifications, using OpenAPI, MariaDB, and Elasticsearch.

TECHNICAL SKILLS

Languages	Go (Golang), Python, SQL, Shell, C++
Backend & APIs	Microservices, System Design, REST / OpenAPI, Go Concurrency, Echo, JWT & RBAC, Pub–Sub, Algorithms & Data Structures
Data & Search	MongoDB (indexing, aggregation, query optimisation), PostgreSQL, Redis, DynamoDB, Elasticsearch, Kafka, S3 / MinIO
Distributed Systems	Raft consensus, Consul service mesh, Kubernetes controllers / CRDs / operators, IPsec, VxLAN, OVS
Cloud & DevOps	AWS, Docker, Helm, Terraform, Crossplane, FluxCD, KubeVela, Linux, Prometheus, Grafana, Git, CI/CD (GitHub Actions, Jenkins)

EDUCATION

University of Engineering, Chandigarh University

2017–2021

B.E., Computer Science and Engineering · GPA 7.4 / 10

Mohali, Punjab
